Summary of Contact Tracing

- ▶ We can stop transmission of COVID-19 if we can identify cases and their contacts quickly and get them to limit their contact with other people
- ▶ Cases should isolate themselves as long as they are infectious—for at least 10 days after they become ill
- ▶ Contacts must quarantine for 14 days after their last contact with an infectious patient
- ▶ Some cases may have close contact with many people because of where they have been or where they live, and these situations should be immediately reported to your supervisor
